

High Speed Accurate Counting with Properly Squared Stacks of Paper

Multifeeder Technology, Inc. manufactures automatic paper feeding and collating systems that create square stacks of paper while accumulating accurately to the correct count. This system continuously aligns the stack in both the X and Y direction since it is very costly to automatically square stacks of paper after they have been accumulated. Excellent product eye appeal for customers is the result.

The squared stacks are then transferred onto the Collating conveyor specifically designed by Multifeeder to maintain the squared stack of paper, as the paper advances for over-wrapping, cartoning, traying or film wrapping.

Multifeeder's superior computer controlled servo-motor technology and patented mechanics, monitors and controls the feeding and counting process, providing accurate product counts at unmatched speeds while gently maintaining optimum quality.

Contact Multifeeder Technology for high performance systems.
