

SAVE ON CONVEYOR COSTS AND SPACE

The discharge of the Multifeeder Technology friction feeder provides an alternative to tasks that previously required a friction feeder and additional conveyor. Applications such as inkjet printing, wipe on labeling, tamp on labeling and bar code verification are some of the on demand tasks that can now be performed directly on the discharge of the Multifeeder friction feeder discharge instead of an additional conveyor.

The discharge provides a steady and sturdy surface for a second machine to apply a label or code onto a product as it travels on the discharge of the Multifeeder Technology friction feeder. The feeders are controlled by an on board computer and a brushless servo-motor with encoder feed back to allow the feeder to present the products on the discharge at a consistent speed with tightly controlled starts and stops. The batch counting function of the feeder can be utilized to count a certain number of products into a group before additional processing.

Contact Multifeeder Technology for additional information on your application.
